

## The Laptop Screen Disabler

We know companies are always looking for ways to improve their employees' performance in the field. Having a laptop in the vehicle is a great productivity tool. We understand this and have been making mobile office products for over 15 years. We realize though that driving while using a laptop is dangerous and that is why we created the Laptop Screen Disabler.

### How it Works:

Install the software and plug in the Dongle (our accelerometer) into the USB port on your laptop and that's it - you're ready to go! Place the laptop in your vehicle (mounted on a stable work surface); when the vehicle begins to move the accelerometer senses the motion and the software automatically blanks-out the screen on your laptop. When your vehicle stops, your laptop screen starts back up, allowing you to continue working where you left off. The Laptop Screen Disabler does not interfere with or disable any programs on your laptop.

### Extra Security Measures:

If your laptop is stolen and the USB Dongle is removed, the thief will not be able to operate your laptop or visibly access any files. (Employees should always take the USB Dongle with them when leaving the laptop in their vehicles.)

### Success Story

In 2006, the first Laptop Disabler was installed into the vehicles of a major utilities locating company. Leading up to the installation, this company was experiencing a 25% accident rate, with an average of \$2,800.00 per-claim. In one year, they reported a 38% drop in vehicle accidents. The ROI on this installation was 6 months.

### Your Bottom Line

Cutting down on costly accidents is a primary objective for every safety committee and can greatly affect your bottom line. Contact us if your ready to make a difference.
